The Atlas of Marine Invertebrate Larvae is the most comprehensive guide to larval form and anatomy ever produced. Each chapter provides a referenced overview of life cycles, reproduction, embryology, larval life, larval form and metamorphosis in a particular group of invertebrates. More than 1200 drawings and photographs illustrate the gross anatomy of all known types of marine larvae and provide a visual survey of the range of larval diversity within each phylum. This book assembles the best larval photographs previously published in scientific literature into one place. Many of the plates, which include color photographs and numerous scanning electron micrographs, are original. Contributed chapters and illustrative material is covered by more than 50 recognized authorities on larval development from throughout the world. \* Provides glossy photographs of all known types of marine invertebrate larvae in a single reference \* Includes juvenile forms, paralarvae, etc. of several groups with direct development \* Illustrates metamorphosis from larval to juvenile form for most groups \* Provides brief synopses of life history biology, larval development, embryology, and metamorphosis \* Provides key references to review articles and classic works

This reference work is designed to provide background information on an array of northeastern Pacific marine invertebrate species so that they can be more easily included in comparative studies of morphology, cell biology, reproduction,

embryology, larval biology, and ecology. It is meant to serve biologists who are new to the field as well as experienced investigators who may not be familiar with the invertebrate fauna of the northern Pacific Coast. The species discussed in this volume are mostly from the cold temperate waters of the San Juan Archipelago, near Puget Sound and the Strait of Georgia, but the information and methods given will be useful in laboratories from Alaska to central California and applicable to some extent in other coastal or inland facilities. An introductory chapter discusses basic procedures for collecting and maintaining mature specimens, for initiating spawning, and for culturing embryos and larvae in the laboratory. Subsequent chapters summarize reproduction and development in thirty different invertebrate groups and provided recent references through which additional information can be traced, cite monographs or keys needed to identify species, and give methods useful for studying an array of selected species. Available information on habitat, diet, reproductive mode, egg size, developmental pattern, developmental times, larval type, and conditions for settlement and metamorphosis is reported for over 450 species.

The drawings are accompanied by notes on the classification, life cycle and habitat of each species. In addition to a taxonomic index of all names used in the drawings and the notes, an anatomical index guides the user to developmental stages, mouthparts, dissections, histological sections and other kinds of views.

This is the first book to provide a detailed treatment of the field of larval ecology. The 13 chapters use state-of-the-art reviews and critiques of nearly all of the major topics in this diverse and rapidly growing field. Topics include: patterns of larval diversity, reproductive energetics, spawning ecology, life history theory, larval feeding and nutrition, larval mortality, behavior and locomotion, larval transport, dispersal, population genetics, recruitment dynamics and larval evolution. Written by the leading new scientists in the field, chapters define the current state of larval ecology and outline the important questions for future research.

Animals have been studied for centuries. But what are the most important and relevant reference and information sources in the zoological sciences? This work is a comprehensive, thoroughly annotated directory filled with hundreds of esteemed resources published in the field of zoology, including indexes, abstracts, bibliographies, journals, biographies and histories, dictionaries and encyclopedias, textbooks, checklists and classification schemes, handbooks and field guides, associations, and Web sites. A complete revision of the award-winning *Guide to the Zoological Literature: The Animal Kingdom* (1994), this new title includes extensive, up-to-date coverage of invertebrates, arthropods, vertebrates, fishes, amphibians and reptiles, birds, and mammals. In addition, the work features a detailed introduction by the author, as well as thorough subject, title, and author indexes. Students and researchers can now quickly and easily pinpoint works in their field of study. The book is of equal importance to LIS students specializing in science or biology librarianship, as it provides a comprehensive, straight-forward overview of zoological information sources. An essential addition to the core reference collection of public and academic libraries!
