transformer. At high frequencies, cores with unused window area pro-duce excessive core losses due to the unnecessary magnetic path length of the core. It is advisable in this case to select a core with a smaller diameter, but with the same cross-sectional area, to insure that the windings will completely fill the core window. Figure 4

Core Selection for Saturating Transformers

Selection of the magnetic core for the transformer depends on the shape and material. The physical diagram shown for the core in Fig. 21.6 is updated when you select another shape such as a toroid, EE or UU.

Core Selection by WaAc Product. The power handling capacity of a transformer core can also be determined by its WaAc product, where Wa is the available core window area, and Ac is the effective core cross-sectional area. Using the equation shown below, calculate the WaAc product and then use the Area Product Distribution (WaAc) Chart to select the appropriate core. WaAc = Product of window area and core area (cm 4) P o = Power Out (watts)

The Purpose of the Magnetic Core The fundamental purpose of any magnetic core is to provide an easy path for flux in order to facilitate flux linkage, or coupling, between two or more mag-netic elements. It serves as a "magnetic bus bar" to connect a magnetic source to a magnetic "load". In a true transformer application, the magnetic
