Special Topic Issue: Neuropsychobiology 2000, Vol. 42, No. 1 This publication examines whether Ecstasy (MDMA) is neurotoxic in humans and comprises research papers from a Novartis Foundation Discussion Meeting on this topic.

MDMA (Methylendioxyamfetamine) (Neuropsychobiology ...

The principle constituent of Ecstasy -- 3,4-methylendioxyamfetamine (MDMA) -- can produce robust deleterious effects on serotonergic functioning in animals, including serotonin depletion and the degeneration of serotonergic nerve terminals (Ricaurte et al., 2000).

MDMA and Ecstasy | Psychiatric Times

Abstract The popular recreational drug, (±)3,4-methylendioxyamfetamine (MDMA; 'Ecstasy') is a potent and selective brain serotonin (5-HT) neurotoxin in animals. MDMA-induced 5-HT neurotoxicity can be demonstrated using a variety of neurochemical, neuroanatomical and, more recently, functional measures of 5-HT neurons.

3,4-Methylendioxyamfetamine (Ecstasy)-induced ...

3,4-Methylendioxyamfetamine(MDMA),[note 1]commonly known as ecstasy(E) or molly, is a psychoactive drugprimarily used for recreationalpurposes. The desired effects include altered sensations, increased energy, empathy, as well as pleasure. When taken by mouth, effects begin in 30 to 45 minutes and last 3 to 6 hours.

MDMA – Wikipedia

Autonomic hyperactivity is a major feature in patients presenting with MDMA toxicity and is dose-dependent. Typically, MDMA has only 1/10 the CNS stimulant effect of amphetamine. The proposed...

What are the cardiovascular effects of MDMA toxicity?
