All About Shear Wall [Design ... - Structural Guide

A shear wall is simply a cantilevered diaphragm to which load is applied at the top of the wall, and is transmitted out along the bottom of the wall. This creates a potential for overturning which must be accounted for, and any overturning force is typically resisted by hold-downs or tie-downs, at each end of the shear element.

Tables 1 through 3 are for walls with steel studs spaced at no. more than 24 in. on centers. The studs must be doubled at the shear wall ends. Minimum stud size is 3-1/2 x 1-5/8 x 0.033 in. and minimum track size is 3-1/2 x 1-1/4 x 0.033 in. (minimum metal base thicknesses).

Strong-Wall shearwall braced-wall-panel spacing may exceed 25' on-center or begin more than 12'-6" from the end of the braced wall line (such as at each end of a three-car garage or at one end of a two-car garage) provided a continuous header or header splice is used as a collector along the garage front.

An engineer will optimize a shear wall's design to meet the specific demands of a house, which will dictate details like nail size and nailing schedule, hardware placement, and blocking size and orientation. LATERAL:
